Molecular weight of Bn, Me, [Mn(Bicyclam)Cl₂]

$$= (330.52 + 35.45 + 35.45 + 44.96 + 54.94) \text{ amu}$$

$$= 456.36 \text{ amu}$$

250 mg resin = 0.00053125 mol Na sites (calentⁿ → page 61)

In order to occupy 2% Na sites,

M-L complex needed → $0.00053125 \times \frac{2}{100} = \text{mol}$

$$= 0.000010625 \text{ mol Na-sites}$$

$$= 0.000010625 \times 456.36 \text{ g}$$

$$= 4.85 \times 10^{-3} \text{ g} = 4.85 \text{ mg}$$

Thus, for 250 mg resin (Amberlite IRA-200C (Na)), 4.85 mg of Bn, Me, [Mn(Bicyclam)Cl₂] complex is required, (for 2% site binding)

set ② → dye + complex + H₂O₂ (last run, did not do good)

Michaelis-Menten Rate Constant calculation
for Mn(Alyl Me Bayelan)Cl₂ Polymer (LG-117)
for degradation of MO ⇒

time → Abs (we have it)

calculate ΔA, (A_t - A₀) at given t

ΔA is product conc.

calculate Rate of formation of Product

$$v(\text{rate}) = \frac{\Delta A}{t} \text{ unit} \rightarrow \text{min}^{-1}$$

Beer's law, A = εcl

calculate ε, from A₀ = 0.3725, c = 1.53 mM, l = 1 cm

$$\epsilon = \frac{A_0}{cl} = 0.24346 \text{ mM}^{-1} \text{ cm}^{-1}$$

Now, calculate substrate conc. [S]

using A_t, ε is known. $A = \epsilon [S] \Rightarrow [S] = \frac{A_t}{\epsilon}$

99
